Vice-county Table

This table presents summary information for each vice-county that returned data. Some information was returned pertaining to the number of guests attending organised events; public event attendance figures are in brackets where known; a question mark denotes no attendance figure supplied. The 'Species Total' column shows the total number of species recorded (bold) and the breakdown of first macro- and then micro-moth species. The number of recorders is the minimum count as multiple recorders are listed for some sites. An asterisk (*) prefix denotes the dataset was verified and returned by the County Moth Recorder.

Appendix 2

Systematic Section

This section details all the species reported over the three nights. The first figure depicts how many individuals of each species were recorded; the second figure is the total number of sites at which the species was recorded. Following the number of sites is a guide to the location of these sites; where a species was only recorded from a single site this is named with the vice-county number in brackets; where a species was recorded from \leq five sites, the vice-county numbers are listed and for more widespread species the regions are given as defined in the table below.

Critical species normally requiring confirmation by reference to genitalia continue to be accepted as submitted rather than being placed into aggregate groups; however, vice-county moth recorders retain the right to reject these data or aggregate them as necessary. Vague records such as '*Acleris* sp.' or 'Pug sp.' are rejected.

Where reasonably possible, all records using the same site name and/or within the same 1km square are classed as a single site and where a species was recorded as ‘0’ or ‘present’ with no assessment of abundance, this was replaced by ‘1’, the minimum count required.

Nomenclature follows that defined by the current MapMate Taxa Library; binomials are used throughout, except where ambiguity with the vernacular may exist between sub-species and forms.
